Abstr Jour : Ref Zhur - Fizika, No 6, 1958, No 12351

Author : ~~Klarfeld S.~~
Inst : Not Given
Title : Conservation Laws in the Popp Electrodynamics

Orig Pub : An. Univ. "G.J. Parhon". Ser. stiint. natur., 1957, No 15, 63-66

Abstract : The author examines the laws of conservation and the expression for the symmetric energy-momentum tensor in the Popp-Podol'skiy electrodynamics. To obtain $T_{\mu\nu}$, use is made of the Noether theorem and of the symmetrization of the canonical tensor by the Belinfante method. The results agree with that obtained by the author with the Hilbert method.

Title : On the Variational Principle in Field Theory

Orig Pub : Commun. Acad. RPR, 1958, 8, No 2, 159-163

Abstract : It is shown that if the Lagrangian function $L(\psi_A, \dot{\psi}_A; \sigma)$ is a quadratic invariant, built up of the potential ψ_A and their derivatives (which corresponds to the linear theories), then the symmetrization of the canonical energy-momentum tensor cannot be realized by changing the Lagrangian function in accordance with the formula $L' = L + \partial_\alpha \Lambda_\alpha$.

AUTHORS: Tolgyessy, J., Čardínová, M., Klas, J.

TITLE: Determination of calcium salts by measuring the intensity of reflected beta radiation.

PERIODICAL: Chemické zvesti, ¹⁷no. 2, 1963, 140-145.

TEXT: Beta radiation particles change their direction of flow by interaction with atoms. Backward flow is called reflected radiation. Mechanism of this is complicated and not fully explained; empirical knowledge allows use of it in chemical analysis. Reflection depends on atomic number of the examined material, thickness of the sample, its geometrical shape and physical properties. The authors applied the method for the determination of Ca in an injection solution of Ca gluconate, CaCl_2 solution and in yellow sulfur ointment (Unguentum sulfuratus flavum). The apparatus consisted of a ring shaped radiation source with a lead shield and a Geiger-Müller counter. The authors used $\text{Tl } 204$ with a half-life of 2.7 years and an energy of 0.76 MeV. A working method is described and a calibration curve is shown, which was designed for the apparatus using samples of known concentration of calcium. Results obtained with the 3 chemicals mentioned were within 1%. The method gives fast results without damage to the analysed sample. 3 figures, 3 tables, 2 Western, 6 Czech

AUTHOR: Klee, Jan (Klee, Ja.) (Chemist)

TITLE: Analysis of multicomponent systems by means of reflected Beta radiation

SOURCE: Chemische weekb., no. 2, 1964, 144-147

TOPIC TAGS: multicomponent system, two-component system, Beta radiation reflection, system analysis, chemistry

ABSTRACT: Equations for the analysis of multicomponent mechanical mixtures are followed step by step. It is shown, that when i (the number of different kinds of atoms in the system) is equal to 3, the determinants of a system of equations will be equal to zero and the system will have no solution. Thus, it is possible to write only one equation on the basis of reflected Beta radiation measurements and only two-component systems can be analysed. The two parts of a two-component system are represented by their average atomic numbers average $Z_{\text{sub } 1}$ and average $Z_{\text{sub } 2}$, which are constant for the given system. The corresponding Beta radiation reflection constants are average $n_{\text{sub } 1}$ and average $n_{\text{sub } 2}$. Proportions by weight, $a_{\text{sub } 1}$ and $a_{\text{sub } 2}$. Then $\text{aver. } Z = a_{\text{sub } 1} \text{ aver. } Z_{\text{sub } 1} + a_{\text{sub } 2} \text{ aver. } Z_{\text{sub } 2}$; $\text{aver. } n = a_{\text{sub } 1} \text{ aver. } n_{\text{sub } 1} + a_{\text{sub } 2} \text{ aver. } n_{\text{sub } 2}$; $1 = a_{\text{sub } 1} + a_{\text{sub } 2}$.

Orig Pub : Bull. scient. Conseil acad RIVY, 1956, 3, No 2, 52-53.

Abstract : Experiments in 1953 with *Ricinus communis*, conducted in the Institute of Experimental Biology of Zagreb Academy, confirmed the results of previous experiments in 1936 and 1951. Insufficiency of N or K elements [Krona N or K] could not be compensated by adding crushed brown coal from Zenika to the nutritive solution. Brown coal cannot serve as a direct source of mineral nitrogen or potassium

"Changes in Physiologic Regulation of Plant Transpiration Ascribable to Industrial Pollutants."

Bratislava, Biologia, Vol 18, No 8, 1963; pp 565-578.

Abstract [Russian article; German summary modified]: Histologic and metabolic studies of effect of some fluorine compounds commonly present in industrial pollutants onto *Cucumis sativa* L., applied as spray or in powder form. The changes in intensity of stomatal and cuticular transpiration were of greater importance than actual total effect on transpiration as such. The stomata closed and cuticular lesions appeared. When they are wet, trichomes lose their protective capacity. Five tables, 5 graphs; 8 photomicrographs; 1 Czech, 2 Soviet and 23 Western references.

TITLE: Formation of Near-Electrode Layers in Powder-Compacted Semiconductor Materials

PERIODICAL: Uch. zap. Rishsk. ped. in-t. 1957, Vol 4, pp 143-148

ABSTRACT: Near-electrode layers in powdery semiconductor materials formed by pressed-in electrodes have been studied. Samples compacted from NiO (black), ZnO, CdS, and others have been investigated. Some samples are cylindrical with the electrodes on top and bottom; other samples are pressed in a metal ring with an axial electrode. Both types of samples have been investigated in a vacuum and in a gas atmosphere. An electric measurement scheme is presented. Data on humidity and gas influence upon the electric properties of the samples is submitted. The best NiO samples have an EMF as high as 0.08 v but have a slightly unipolar conductance.

TITLE: Measurement of the activity of organic compounds containing tritium

PERIODICAL: Zavodskaya laboratoriya, v. 28, no. 3, 1962, 305 - 307

TEXT: A variant of K. E. Wilsbach's method (Ref. 3, see below) is described. The tagged organic substances are heated with zinc dust, nickel oxide, and water in an ampoule at 640°C for 3 hr. The temperature is measured with a Chromel-Alumel thermocouple connected to an ERM-47 (ERM-47) apparatus. The resulting methane and hydrogen (pressure 20 mm Hg) are pumped into an CEM-8 (SBM-8) counter, and cyclohexane is added up to a total pressure of 40 mm Hg. The activity is measured with a β (B) radiometer. By using cyclohexane instead of butane as quenching gas, the $\text{CH}_4 + \text{H}_2$ concentration can be increased and the size of the apparatus reduced. The method was used to measure the activity of tagged cyclohexene, cyclohexadiene-1,3, and adipic, succinic and glutaric acids. The error of measurement was not more than 1%. The accuracy of measurement

Card 1/2

Measurement of the activity...

S/032/62/020/003/008/017
B101/B138

does not depend on the amount of H_2O added. Therefore it is possible to convert tagged organic compounds without H_2O addition, which is important for measuring only slightly radioactive preparations. There are 3 figures, 1 table, and 4 references: 1 Soviet and 3 non-Soviet. The three references to English-language publications read as follows: Nucleonics, 16, no. 3, 62 (1958); R. L. Wolfgang, C. F. Mackay. Nucleonics, 16, no. 10, 69 (1958); K. E. Wilsbach, L. Kaplan, W. G. Brown. Science, 118, 522 (1953).

TITLE: Reconstruction of a Continuous Furnace (Rekonstruktsiya metodicheskoy pechi)

PERIODICAL: Metallurg, 1958, ³Nr 2, 28 - 29 (USSR)

ABSTRACT: In 1954, designs by the Sverdlovsk branch of the Gipromex were used in the reconstruction of Nr 2 reheating furnace (Fig.1) in the rolling-mill shop at the Gur'yevsk Metallurgical Works. The object was to raise productivity from 7-9 to 20 tons/hour. The reconstructed furnace worked badly because the combustion-chamber grate was unsuitable for the 6-10% ash coal and fuel consumption rose to 209 kg of coal/ton. A further reconstruction (Fig.2) was carried out, sloping grate bars and medium-pressure air being provided. Ash removal was mechanised and was effected in 10-15 min (compared with the 8 hours required previously) without interference with furnace operation: coal consumption decreased to 155-165 kg/ton. There are 2 figures.

TEXT:

The purpose of this work was to check the hypothesis that both the first (shear) viscosity and the electrical conductivity of liquid metals and their solutions are related to the short-range order. The viscosity, density and electrical conductivity of zinc and cadmium amalgams were measured at temperatures up to 350°C in a wide range of compositions. Amalgams with the same viscosity had the same short-range order but different electrical conductivities. Amalgams with the same electrical conductivity had practically the
